KNOW THE SYMPTOMS AND ACT FAST

Heart Attacks: How Women Can Beat the Odds

If you experience any symptoms of a heart attack, call emergency services immediately or seek medical attention. For more information about heart health, please visit www.abbott.com and www.worldheart.org.

*Abbott’s ARCHITECT STAT High Sensitive Troponin-I (hsTnI) test is commercially available outside of the United States. The test is in development and not commercially available in the United States.

IMPACT OF HEART DISEASE
Cardiovascular or heart disease is a broad term for a range of diseases affecting the heart and blood vessels. Women account for half of the 16.5 million cardiovascular deaths that occur globally each year.

HEART ATTACK SYMPTOMS
Chest pain is the most common symptom. Some symptoms are more likely to be experienced by women than men, including:
- Shortness of breath
- Nausea/vomiting
- Back or jaw pain

GOOD NEWS
A British Medical Journal study suggests that Abbott’s high sensitive troponin test* may help pick up twice as many women’s heart attacks as standard blood tests.

IMPORTANCE to WOMEN
Abbott’s high sensitive troponin test* can measure very low levels of cardiac troponin. This is especially important for women, who often have lower levels of troponin than men.

WHAT IS TROPONIN?
Cardiac troponin is a protein that can indicate injury to the heart muscle. Troponin levels rise when heart cells are damaged. Doctors use blood tests to detect changes in these levels to help diagnose heart attacks.
